Trends:		We saw corn coming in with low protein in the range of 6.5-7%. Firms were slow to compensate in formulation. There was also a shift in Phosphorus levels, likely in dical. Selenium continues to run much higher than label guarantees. There appears to have been a problem with the vitamin A-30 during the summer that affected several feeds. The screening for heavymetals on 20% of the samples is showing an occasional spike of cobalt in the premixes that was unexpected, but not beyond safe levels.
